

In re Application of Günter Tremmel et al.
Attorney Docket: 47623-0003
Response to Office Action dated March 16, 2007

AMENDMENTS TO THE SPECIFICATION

Please replace paragraph [0022] with amended paragraph [0022]:

[0022] The bearing bodies 17 are shaped in cross section such that they have a place in the roof channel below the cover strip, and can be elastically connected to the strip edges 25 and 26 of the roof channels, which have been flanged all around toward the inside (shown in FIGS. 3-5). For this purpose, hooks 24, which project to the outside, are shaped on the upper edge of a side wall 18, for engaging in the strip edge 25, and on the upper edge of the side wall 19, lying opposite, catch hooks 27 are also shaped in a region slit on both sides, these springing inwards while being inserted into ~~part~~ cover strip 3, and then again catching above the strip edge 26. The other areas of the side wall 19 are dimensioned such that during the latching of the hooks 27 they bear against the cover strip 3 from below.
